Welcome!

Follett equipment enjoys a well deserved reputation for excellent performance, long term reliability and outstanding after the sale support. To ensure that this product delivers that same degree of service, we ask that you take a moment to review this manual before beginning the installation. Should you have any questions or require technical help at any point, please call our technical service group at +48 58 785-6140.

1. GENERAL INFORMATION

Freezer ZF130 is designed for the catering industry. The cold storage function, ease of move and well designed interior are just the few of the features you will find.

The device is mainly made of stainless steel to fit strict hygiene requirements. Conforming to even toughest standards this device meets all your needs regarding to serve always cool and fresh meals. It is easy to clean and wash. It will therefore last longer in the demanding kitchen conditions and is easier and cheaper to maintain than other materials.

Please have a while and read this instruction. Using Follett equipment according to the following information will let you enjoy with this device.

2. SAFETY RULES

- Unit should be connected to the power socket 230V AC and must be grounded.
- Any changes/amendments should only be made by a qualified electrician.
- Do not exceed the rating of the socket.
- The machine should be washed and cleaned only after disconnecting from the power network (the plug should be taken out of the socket)

Important cautions

- Do not put water into the unit and do not use aggressive detergents to wash it.
- If the supply cable is damaged it should be changed by persons qualified to perform his function.

3. INSTRUCTION FOR THE USER

- The refrigerating chamber should be filled only after the temperature set point has been reached.
- Table should be washed with water and cleaning detergent using a soft rag or a sponge only after the cable has been disconnected from the power network (the plug should be taken out of a socket)
- Do not rub the unit surface across the satin finish lines. Scouring across the satin finish lines can damage the original surface finish.
- Every two months the covering grill of the condenser should be taken off and all dust from condenser removed. A clean air filter and condenser is essential for the freezer to work properly and reaching proper temperature. Areas of extreme dust condition should be cleaned more frequently.
- Do not store spoiled products.
- Do not put warm products into the freezing chamber.
- The doors of the freezer should be opened for the shortest time possible.
- Device requires its own separate circuit with electrical disconnect within 3 meters
- Do not strain the doors.

4. CONTROL PANEL INSTRUCTION

4.1. Turning ON/OFF

To turn on the equipment put the plug into the socket and press the button (red light on the button will turn on). You will see the actual operating temperature on the control panel. Unit turns on the condensing unit and it will take approximately 30 minutes to reach the set point temperature.

To turn off the unit just use the switch again. Please be sure you do not store any goods inside the unit when it's turned off!

4.2. Defrost procedure

During the normal operation there is a thin layer of frost on the walls inside the freezing chamber. If there is a plenty of frost or ice on the interior walls, it is necessary to defrost the unit. You need to remove all the ice from chamber so the refrigerator can work properly and reach the set point temperature. It's essential that the temperature probe located in the corner of the chamber is free of any ice forming process.

Manual defrost mode turns off the compressor and the condenser fan. Water formed during the melting of ice is removed after unplugging the spout cup thru the hose located on the bottom of the chamber directly to the floor, so after cleaning and defrosting procedure it's needed to flush the unit and purge the water to external drainage system.

If you are not able to remove the ice by manual defrosting, it may be necessary to disconnect the refrigerator for a longer period of time to completely defrost the evaporator.

To start defrosting:

- Push the  button for 4s

4.3. TEMPERATURE SET POINT

The factory setting is **-19 °C**. This setting allows you to cool products and maintain food at a specified temperature range of **-18 : -20 °C**. Changing the settings outside the temperature range of -18: -20 °C is not advisable! Lowering the temperature setting may result in the product frosting, frost evaporator and compressor hard work. To check the current setting, press the **SET** button for 2s. If for some reason refrigerator has a different setting than the factory, perform the procedure for changing the settings as described below.

- Press **SET** button, LED symbol. Display will show temperature point and scale (°C or °F)

- press  or  until you get required temperature

- press **SET** to confirm changes

7. CLEANING INSTRUCTION

According to requirements of hygienic conditions of storing and preparing food products, it's necessary to care about refrigerator cleanliness

7.1. Chamber cleaning

Interior of chamber, have to be cleaned by water with addition of detergent. Rub the surface using sponge or soft rag. Cleaning have to be provided when refrigerator is defrosted and disconnected from electricity. Device can be started again only when interior is completely dry.

7.2. Housing cleaning

External surfaces of refrigerator, have to be cleaned by water with addition of detergent. Rub the surface using sponge or soft rag. During cleaning metal parts it's necessary to wipe in direction of material grinding- for save aesthetic appearance.

7.3. Condenser cleaning

To save optimal parameters of refrigeration unit, it's necessary to clean the condenser once a month. After take off condenser cover, clean using soft brush or compressed air

CAUTION!

- **Do not put water into the unit and do not use aggressive detergents to wash it.**

8. TRANSPORT

- The equipment is packed with stretch rap and protecting corners.
- Unit is attached to the pallet (transport in a working position only).
- During the transport do not hit the equipment and ensure that it is secured safety.
- All claims for damages occurred due to the transportation should be addressed to the delivering company.

Important cautions

- **Manufacturer does not hold responsibility for equipment that has been broken (damaged) during transportation.**
- **Unit should not be tilted into a sloping position with an angle higher than 45°**

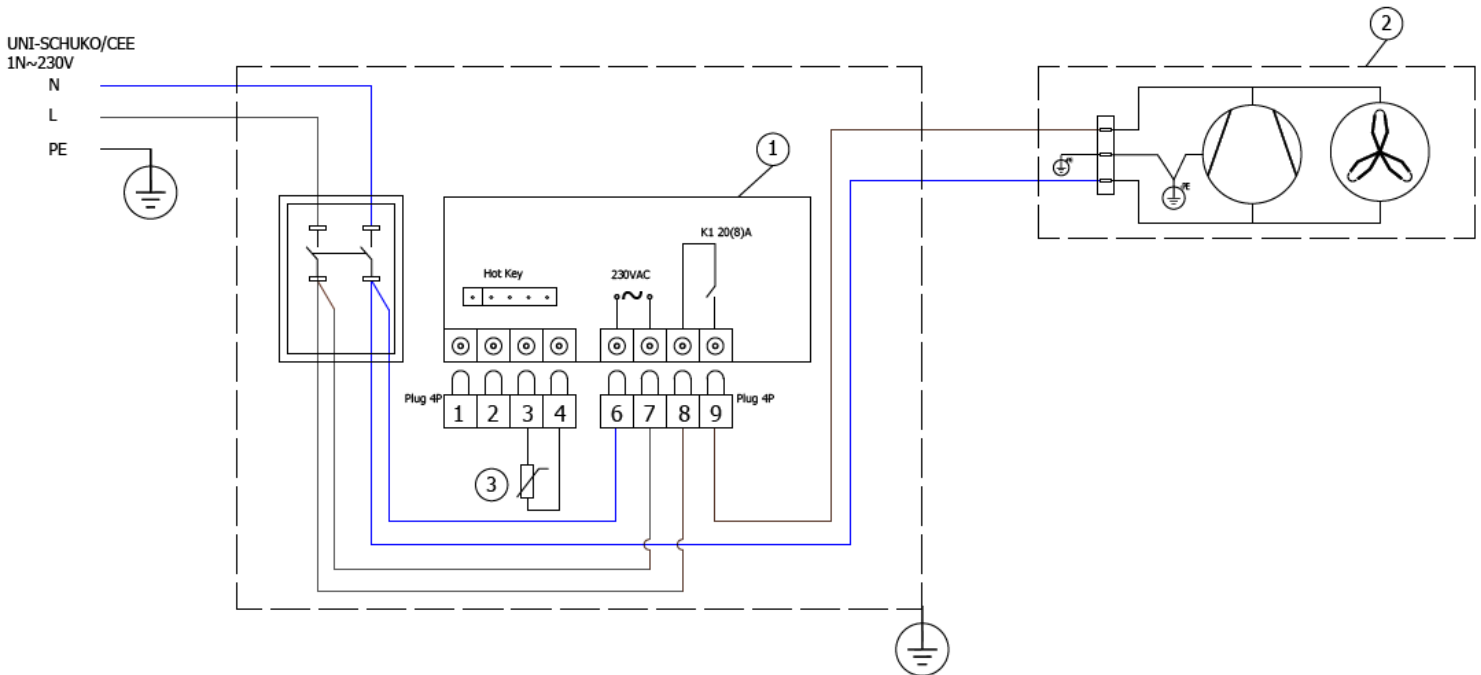

9. TROUBLESHOOTING GUIDE

Before calling for service:

1. Check that unit is plugged in.
2. Test outlet with another mobile device to verify power.
3. Check if the chamber isn't covered with ice and unit need to be defrosted
4. Check if the condenser isn't contaminated or covered.

Symptom	Possible causes	Solution
<i>Freezer does not operate.</i>	on/off switch faulty or in OFF position (red light on the switch doesn't work); loose connection	Turn on/off switch to ON position (red light should work); check switch and connections
	Unit not plugged in	Connect the plug
	No power supply in network	Check the fuses in Main Distribution Board
<i>Freezer does not reach the set point temperature (all components run).</i>	Chamber covered with the ice. Interior might be covered with too much ice, what is wrong!	Defrost the unit, if needed turn off the unit for a longer period of time to remove all the ice (switch off the unit and leave doors opened)
	Condenser or air filter of the cooling unit is dirty	Clean the condenser with a brush or a compressed air/vacuum cleaner (grill cover on the front)
	Condenser fan defective – high pressure.	Check the condenser fan – if you have a voltage on wirings and the fan doesn't turn, you need to order new fan
	Temperature probe faulty or situated improperly.	Check temperature probe – if needed call for service.
<i>Alarm: P1</i>	Fault of chamber temperature sensor	Check cable, connections.
		Change sensor
<i>Alarm: P2</i>	Fault of evaporator temperature sensor	Check cable, connections.
		Change sensor
